Defining Leather Through Design

SIF Technology

SIF Technology's digital image process means that for the first time ever an unlimited Pantone palette of colors and images are now available for use on real leather. Images, text and special effects become an integral part of the grain of genuine leather. Any color, texture, design or image can be fused naturally onto and into the leather grain.

With features such as genuine leather, high quality digital imagery, on-demand custom orders and Pantone color matching, SIF Digital Leather is defining leather through design. Digitally imaged leather upholstery starts at \$29 per square foot.

SIF Technology is comprised of engineers, designers, developers and marketers of digital print media created for the most well known [digital imaging](#) Brands in the world.

With the invention of SmartFilm, SIF Technology has gathered a core team of professionals dedicated to bringing to the interior design, architectural and fashion design industry a beautification capability sought for decades.
